CRM Sales Pipeline Analysis

Power BI Portfolio Project

Project Notes

Joseph Yohannes

Power BI • Power Query • DAX

1. Project Overview

Project Objective

Analyse a B2B CRM sales pipeline to understand sales performance and identify opportunities for improvement across sales agents, products, teams/regions and customer sectors.

Main Business Questions

Area	Business Question
1. Sales Agent Performance	Which sales agents are the strongest performers, and what distinguishes their performance from the rest of the team?
2. Product Performance	Which products perform best commercially, and what appears to drive the differences in revenue, deal wins and conversion?
3. Manager & Regional Performance	Which managers and regional offices generate the highest Won Revenue and Win Rates, and how much of their performance appears linked to opportunity volume and product mix?
4. Customer Sector Performance	Which customer sectors generate the strongest sales performance, and what appears to be driving the differences in Won Revenue and Win Rate?

2. Dataset & Data Model

Dataset Source

The dataset used for this project is CRM Sales Opportunities, obtained from the Maven Analytics Data Playground.

It contains 8,800 sales opportunities from a fictional B2B company selling computer hardware, alongside information on sales teams, products and customer accounts.

Source: [Maven Analytics — CRM Sales Opportunities]

Tables

sales_pipeline — Fact Table

One row represents one sales opportunity.

- opportunity ID
- sales agent
- product
- account
- deal stage
- engagement date
- close date
- close value

sales_teams — Dimension Table

- sales agent
- manager
- regional office

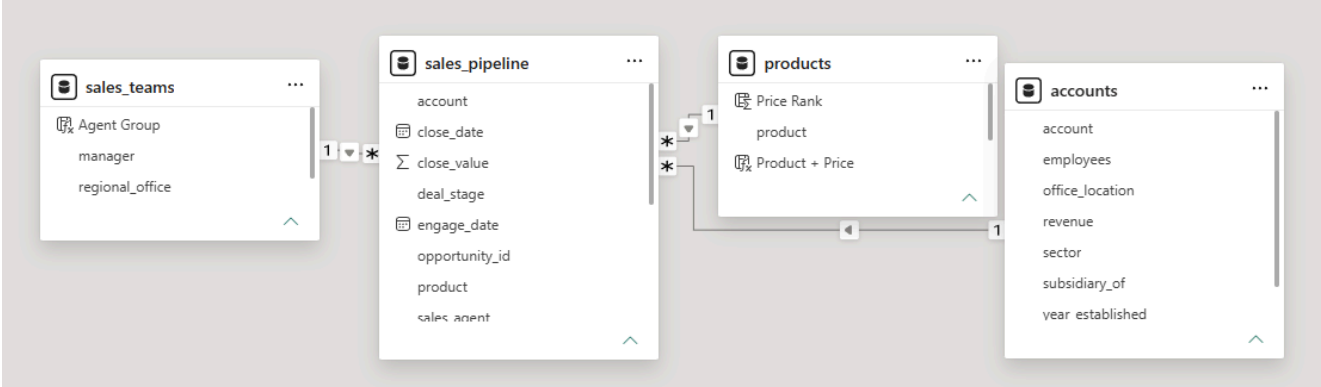

products — Dimension Table

- product
- product series
- sales price

accounts — Dimension Table

- account
- sector
- employees
- revenue
- office location
- year established
- subsidiary information

Relationships Created

Model structure
sales_teams (1) → sales_pipeline (*)
products (1) → sales_pipeline (*)
accounts (1) → sales_pipeline (*)

Relationships use single-direction filtering from the dimension tables to the fact table.

3. Data Cleaning / Quality Checks

Product Name Mismatch

A product was recorded differently between the fact and product tables:

- **sales_pipeline:** GTXPro
- **products:** GTX Pro

Because Power BI relationships depend on matching values, this caused GTX Pro sales to appear under a blank product row when using the products dimension.

Fix: Used Power Query → Replace Values to change GTXPro to GTX Pro in sales_pipeline.

Why: This corrected the relationship between the fact and dimension tables and prevented incorrect or blank product results in visuals.

Unassigned Customer Sector Opportunities

While analysing customer sectors, I found 1,425 opportunities with no sector assigned. I investigated the records using Deal Stage and found that all 1,425 were still open opportunities:

- 1,088 Engaging
- 337 Prospecting

These opportunities do not yet have a completed outcome and are not linked to a customer sector, which explains why they have no Won Revenue, Won Deals or Win Rate.

I kept these opportunities in the dataset because they are still valid pipeline records. However, I excluded the blank sector from the customer-sector performance visual because the opportunities have not yet been linked to a customer sector and are still at the Prospecting or Engaging stage.

As a result, they have no Won Revenue or completed sales outcomes to calculate a Win Rate, meaning they don't provide useful information for comparing customer-sector performance.

Analysis decision
The original pipeline data was kept intact. The blank sector was excluded only from the sector-level performance analysis.

4. Measures & Calculated Fields

Measures Created

Won Revenue

```
Won Revenue =
CALCULATE(
    SUM(sales_pipeline[close_value]),
    sales_pipeline[deal_stage] = "Won"
)
```

Measures total revenue from successfully won opportunities.

Won Deals

```
Won Deals =
CALCULATE(
    COUNTROWS(sales_pipeline),
    sales_pipeline[deal_stage] = "Won"
)
```

Counts successfully won opportunities.

Lost Deals

```
Lost Deals =
CALCULATE(
    COUNTROWS(sales_pipeline),
    sales_pipeline[deal_stage] = "Lost"
)
```

Counts lost opportunities.

Win Rate

```
Win Rate =
DIVIDE(
    [Won Deals],
    [Won Deals] + [Lost Deals]
)
```

Engaging and Prospecting opportunities are excluded because they do not yet have a final outcome.

Average Won Deal Value

```
Average Won Deal Value =
DIVIDE(
    [Won Revenue],
    [Won Deals]
)
```

Shows the average revenue generated by each successful deal.

Total Opportunities

```
Total Opportunities =
COUNTROWS(sales_pipeline)
```

Used to understand workload and opportunity volume.

Opportunity Mix %

```
Opportunity Mix % =
DIVIDE(
    [Total Opportunities],
    CALCULATE(
        [Total Opportunities],
        REMOVEFILTERS(products)
    )
)
```

Shows what percentage of each group's total opportunities comes from each product. This was used to compare product mix fairly rather than relying only on raw opportunity counts.

Calculated Column

Agent Group

```
Agent Group =
IF(
    sales_teams[sales_agent] = "Darcel Schlechet",
    "Darcel",
    "Other Agents"
)
```

Created to compare Darcel directly against the rest of the sales team in the same matrix.

5. Overall Dataset KPIs

KPI	Result
Won Revenue	**$10.01M**
Won Deals	**4,238**
Win Rate	**63.15%**
Average Won Deal Value	**$2,360.91**
Total Opportunities	**8,800**

6. Question 1 — Sales Agent Performance

Business Question

Which sales agents are the strongest performers, and what distinguishes their performance from the rest of the team?

Metrics Used

- Won Revenue
- Won Deals
- Win Rate
- Average Won Deal Value
- Total Opportunities
- Opportunity Mix %

Visuals Used

- Sales agent performance matrix
- Company-wide and Darcel product performance matrices
- Darcel vs Other Agents product mix comparison matrix

Initial Findings

Sales agent performance overview

sales_agent	Won Revenue	Won Deals	Win Rate	Average Won Deal Value	Total Opportunities/Deals
Darcel Schlecht	1153214	349	63.11%	$3,304.34	747
Vicki Laflamme	478396	221	63.69%	$2,164.69	451
Anna Snelling	275056	208	61.90%	$1,322.38	448
Kary Hendrixson	454298	209	62.39%	$2,173.67	438
Kami Bicknell	316456	174	63.97%	$1,818.71	362
Versie Hillebrand	187693	176	66.67%	$1,066.44	361
Zane Levy	430068	161	61.69%	$2,671.23	349
Cassey Cress	450489	163	62.45%	$2,763.74	346
Jonathan Berthelot	284886	171	64.77%	$1,666.00	345
Gladys Colclough	345674	135	58.19%	$2,560.55	317
Lajuana Vencill	194632	127	54.98%	$1,532.54	311
Corliss Cosme	421036	150	65.50%	$2,806.91	310
Markita Hansen	328792	130	57.27%	$2,529.17	306
Maureen Marcano	350395	149	69.95%	$2,351.64	285
Marty Freudenburg	291195	122	62.89%	$2,386.84	281
Donn Cantrell	445860	158	57.45%	$2,821.90	275
James Ascencio	413533	135	65.53%	$3,063.21	267
Violet Mclelland	123431	122	63.21%	$1,011.73	261

Elease Gluck	289195	80	63.49%	$3,614.94	177
Rosalina Dieter	235403	72	65.45%	$3,269.49	160
Rosie Papadopoulos	230169	78	64.46%	$2,950.88	160
Garret Kinder	197773	75	60.98%	$2,636.97	123
Wilburn Farren	157640	55	69.62%	$2,866.18	110
Total	**10005534**	**4238**	**63.15%**	**$2,360.91**	**8800**

Darcel Schlechet currently has the highest Won Revenue, Won Deals and Total Opportunities.

KPI	Result
Won Revenue	**~$1.15M**
Won Deals	**349**
Win Rate	**63.11%**
Average Won Deal Value	**~$3,304**
Total Opportunities	**747**

Interpretation

Darcel's Won Revenue lead does not seem to be driven by a high overall Win Rate. His 63.11% Win Rate is almost identical to the company average of 63.15%.

Instead, his advantage appears to come from a combination of substantially more opportunities, the highest number of Won Deals and relatively high-value won deals.

Darcel handled 747 opportunities compared with around 451 for the next-highest agent, meaning he handled roughly 65.6% more opportunities.

Initial interpretation
At this stage, Darcel's higher Won Revenue appears to be mainly coming from having more opportunities and higher-value deals rather than a much better overall Win Rate.

Further Investigation — Product Mix

I then looked at Darcel's performance by product to see whether product mix helped explain his revenue advantage.

Company-wide product performance

product	sales price	Won Revenue	Won Deals	Win Rate	Average Won Deal Value	Total Opportunities/Deals
GTK 500	26768	400612	15	60.00%	$26,707.47	40
GTX Plus Pro	5482	2629651	479	64.30%	$5,489.88	968
GTX Pro	4821	3510578	729	63.56%	$4,815.61	1480
MG Advanced	3393	2216387	654	60.33%	$3,388.97	1412
GTX Plus Basic	1096	705275	653	62.13%	$1,080.05	1383
GTX Basic	550	499263	915	63.72%	$545.64	1866
MG Special	55	43768	793	64.84%	$55.19	1651
Total	**26768**	**10005534**	**4238**	**63.15%**	**$2,360.91**	**8800**

Darcel's product performance

product	sales price	Won Revenue	Won Deals	Win Rate	Average Won Deal Value	Total Opportunities/Deals
GTX Plus Pro	5482	176844	33	70.21%	$5,358.91	66
GTX Pro	4821	773129	160	60.38%	$4,832.06	358
MG Advanced	3393	120360	36	59.02%	$3,343.33	78
GTX Plus Basic	1096	61207	56	67.47%	$1,092.98	116
GTX Basic	550	20124	36	67.92%	$559.00	69
MG Special	55	1550	28	65.12%	$55.36	59
GTK 500	26768					1
Total	**26768**	**1153214**	**349**	**63.11%**	**$3,304.34**	**747**

GTX Pro

- 358 opportunities
- 160 Won Deals
- ~$773K Won Revenue
- 60.38% Win Rate
- ~$4.83K Average Won Deal Value

GTX Pro represents a large proportion of Darcel's revenue. However, his GTX Pro Win Rate is not particularly exceptional compared with the wider product performance, suggesting that the high revenue is heavily influenced by volume.

GTX Plus Pro

- 66 opportunities
- 33 Won Deals
- ~$176.8K Won Revenue
- 70.21% Win Rate
- ~$5.36K Average Won Deal Value

Darcel's GTX Plus Pro Win Rate is 70.21%, compared with 63.90% for the other agents. The product makes up only 8.84% of Darcel's opportunities compared with 11.20% for the other agents, so this stronger performance does not appear to be explained simply by higher opportunity volume.

This is one product where Darcel appears to be more effective at converting opportunities than the other agents.

Darcel vs Other Agents — Product Performance

Product mix and performance comparison

Darcel vs Other Agents — Product Performance

Agent Group	Darcel				Other Agents			
Product + Price	Total Opportunities/Deals	Win Rate	Opportunity Mix %	Average Won Deal Value	Total Opportunities/Deals	Win Rate	Opportunity Mix %	Average Won Deal Value
GTK 500 - $26,768	1		0.13%		39	62.50%	0.48%	$26,707.47
GTX Plus Pro - $5,482	66	70.21%	8.84%	$5,358.91	902	63.90%	11.20%	$5,499.57
GTX Pro - $4,821	358	60.38%	47.93%	$4,832.06	1122	64.51%	13.93%	$4,810.98
MG Advanced - $3,393	78	59.02%	10.44%	$3,343.33	1334	60.41%	16.57%	$3,391.63
GTX Plus Basic - $1,096	116	67.47%	15.53%	$1,092.98	1267	61.67%	15.73%	$1,078.84
GTX Basic - $550	69	67.92%	9.24%	$559.00	1797	63.56%	22.31%	$545.10
MG Special - $55	59	65.12%	7.90%	$55.36	1592	64.83%	19.77%	$55.19
Total	**747**	**63.11%**	**100.00%**	**$3,304.34**	**8053**	**63.15%**	**100.00%**	**$2,276.25**

Darcel's product mix is much more weighted towards higher-value products. The three most expensive products make up around 56.90% of his opportunities compared with only 25.61% for the other agents.

The biggest difference is GTX Pro. 47.93% of Darcel's opportunities are GTX Pro compared with 13.93% for the other agents.

This also helps explain why Darcel's overall Average Won Deal Value is higher at $3,304.34 compared with $2,276.25 for the other agents, around 45.2% higher. When comparing the same products, however, Average Won Deal Values are generally similar. This suggests that his higher overall average is mainly coming from product mix rather than consistently closing the same products at much higher values.

His overall Win Rate is almost identical to the other agents at 63.11% versus 63.15%. On GTX Pro, which makes up almost half of his opportunities, his Win Rate is actually lower at 60.38% compared with 64.51% for the other agents.

However, Darcel performs particularly well on some individual products. For example, his GTX Plus Pro Win Rate is 70.21% compared with 63.90% for the other agents.

Key Conclusion

Overall, Darcel's higher Won Revenue appears to be mainly driven by a much higher volume of opportunities and a larger share of higher-value products, rather than being significantly better at closing deals overall. His performance comes from a combination of opportunity volume, product mix and stronger performance on certain individual products.

Business Implication

It may be worth reviewing how higher-value product opportunities are distributed across the sales team and whether any parts of Darcel's product mix or stronger performance on products such as GTX Plus Pro could be replicated across other agents.

7. Question 2 — Product Performance

Business Question

Which products perform best commercially, and what appears to drive the differences in revenue, deal wins and conversion?

Metrics Used

- Sales Price
- Won Revenue
- Won Deals
- Win Rate
- Average Won Deal Value
- Total Opportunities
- Opportunity Mix %

Visuals Used

- Product Performance matrix
- Won Revenue by Product horizontal bar chart

Areas Investigated

- Which product generates the most revenue?
- Which product wins the most deals?
- Which product has the highest Win Rate?
- Which products are high-value but low-volume?
- Which products are low-value but high-volume?
- Does a high product price necessarily lead to high revenue?

Product Performance matrix

Product Performance

Product + Price	Won Revenue	Average Won Deal Value	Won Deals	Win Rate	Total Opportunities/Deals	Opportunity Mix %
GTK 500 - $26,768	400612	$26,707.47	15	60.00%	40	0.45%
GTX Plus Pro - $5,482	2629651	$5,489.88	479	64.30%	968	11.00%
GTX Pro - $4,821	3510578	$4,815.61	729	63.56%	1480	16.82%
MG Advanced - $3,393	2216387	$3,388.97	654	60.33%	1412	16.05%
GTX Plus Basic - $1,096	705275	$1,080.05	653	62.13%	1383	15.72%
GTX Basic - $550	499263	$545.64	915	63.72%	1866	21.20%
MG Special - $55	43768	$55.19	793	64.84%	1651	18.76%
Total	**10005534**	**$2,360.91**	**4238**	**63.15%**	**8800**	**100.00%**

Initial Findings

- **GTX Pro —** highest Won Revenue at approximately $3.51M.
- **GTK 500 —** highest Average Won Deal Value at approximately $26.7K, but very low opportunity volume.
- **GTX Basic —** highest number of Won Deals at 915 and highest Opportunity Mix at 21.20%.

- **MG Special —** highest Win Rate at 64.84%, although Win Rate differences across most products are relatively small.

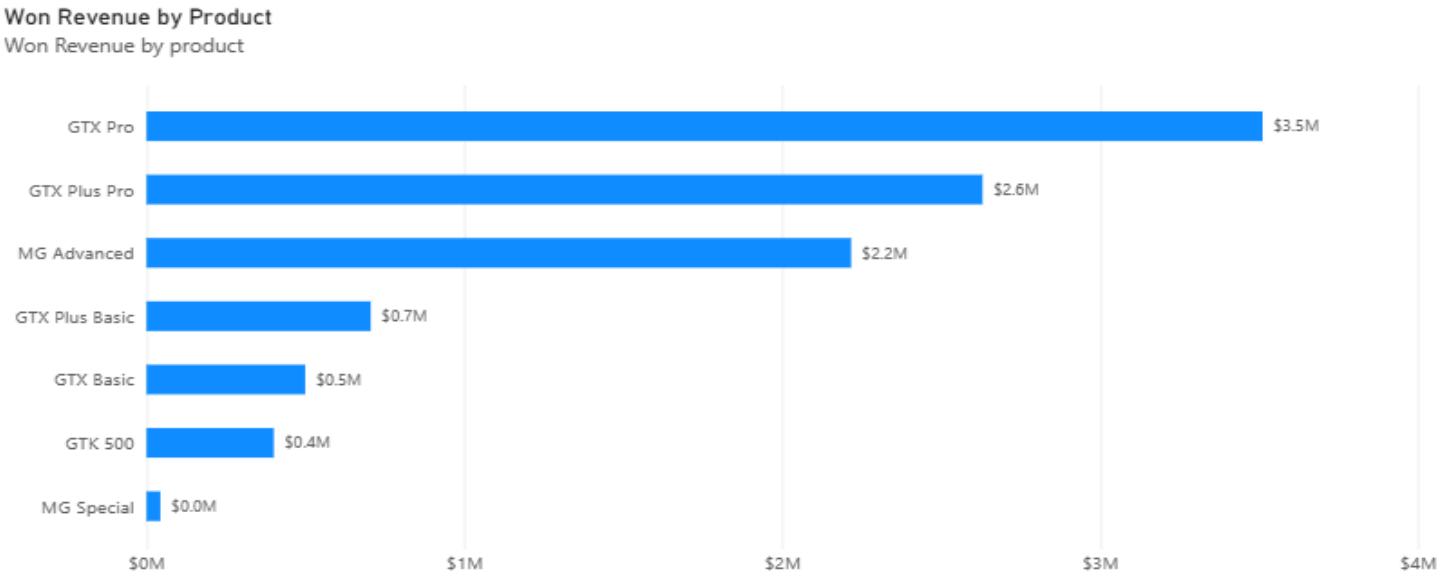

One of the most interesting findings is GTX Basic. It accounts for 21.20% of opportunities but generates only around 4.99% of total Won Revenue, approximately $499K. This shows that high opportunity volume does not necessarily lead to high revenue when the product itself is relatively low value.

In comparison, GTX Pro generates approximately $3.51M in Won Revenue, around 35.1% of the company's total, despite accounting for only 16.82% of opportunities. Its Win Rate of 63.56% is also around the same level as most other products.

GTX Plus Pro shows a similar pattern. It accounts for only 11.00% of opportunities but generates approximately $2.63M in Won Revenue, around 26.3% of the total, while also having one of the highest Win Rates at 64.30%.

Together, GTX Pro and GTX Plus Pro generate around 61% of total Won Revenue despite making up only around 28% of total opportunities.

Won Revenue by Product

Interpretation

This suggests that product value has a major impact on revenue performance. A large proportion of opportunities currently comes from lower-value products, while some higher-value products generate significantly more revenue from a smaller share of opportunities.

Business Implication

It may be worth investigating whether more opportunities can be generated for products such as GTX Pro and GTX Plus Pro. However, the business would first need to understand why their opportunity volumes are lower before changing the sales strategy.

Key Conclusion

The strongest-performing products are not simply the products receiving the most opportunities. Product performance appears to be driven by a combination of product value, opportunity volume and conversion rather than any one metric on its own.

8. Question 3 — Regional and Manager Performance

Business Question

Which managers and regional offices generate the highest Won Revenue and Win Rates, and how much of their performance appears linked to opportunity volume and product mix?

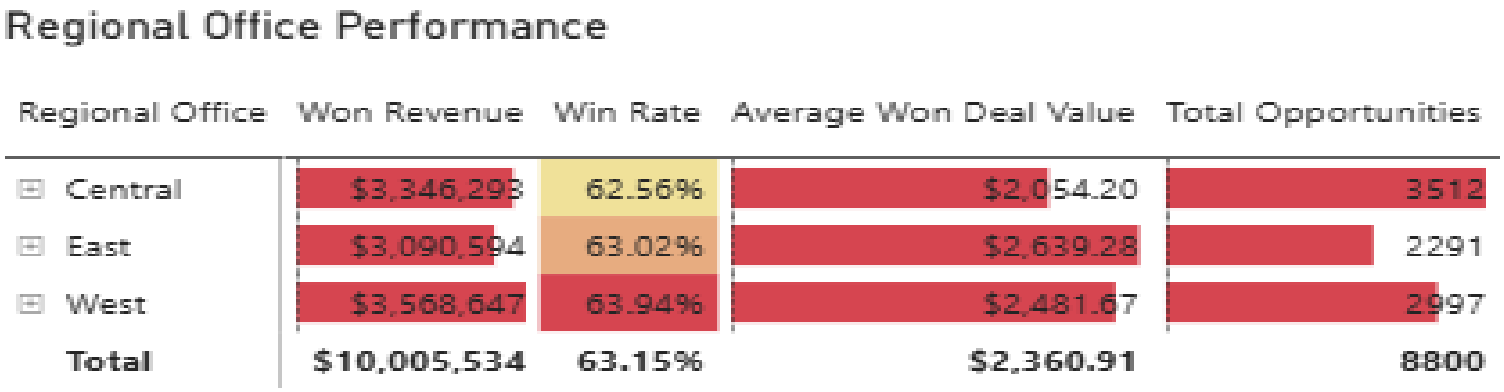

Metrics Used

- Won Revenue
- Win Rate
- Average Won Deal Value
- Total Opportunities
- Opportunity Mix %
- Sales Price

Visuals Used

- Regional Office Performance matrix
- Manager Performance matrix
- Melvin vs Dustin Product Mix Comparison matrix

Regional Office Performance

Regional Findings

Won Revenue is relatively close across all three regions, although West has the highest Won Revenue at approximately $3.57M, followed by Central at around $3.35M and East at approximately $3.09M.

West also has the highest Win Rate at 63.94%, although the differences between the regions are relatively small.

There is more variation in Average Won Deal Value and Total Opportunities. Central has the highest opportunity volume at 3,512, while East has the highest Average Won Deal Value at approximately $2,639.

This suggests that regional performance is not being driven by Win Rate alone. Opportunity volume and the type or value of products being sold may also be contributing to the differences.

To understand this further, I broke the regions down by manager to see whether individual teams were driving the regional results.

Manager Performance

Regional Office	Won Revenue	Win Rate	Average Won Deal Value	Total Opportunities
Central	**$3,346,293**	**62.56%**	**$2,054.20**	**3512**
Dustin Brinkmann	$1,094,363	62.98%	$1,465.01	1583
Melvin Marxen	$2,251,930	62.20%	$2,553.21	1929
East	**$3,090,594**	**63.02%**	**$2,639.28**	**2291**
Cara Losch	$1,130,049	64.43%	$2,354.27	964
Rocco Neubert	$1,960,545	62.08%	$2,837.26	1327
West	**$3,568,647**	**63.94%**	**$2,481.67**	**2997**
Celia Rouche	$1,603,897	63.41%	$2,629.34	1296
Summer Sewald	$1,964,750	64.34%	$2,372.89	1701
Total	**$10,005,534**	**63.15%**	**$2,360.91**	**8800**

Manager Interpretation

Melvin Marxen has the highest Won Revenue of all managers at approximately $2.25M. However, his Win Rate is 62.20%, below the overall average of 63.15% and the second-lowest among managers. His Average Won Deal Value is approximately $2,553, the third highest.

What stands out most is opportunity volume. Melvin handled 1,929 opportunities, the highest of any manager and around 21.9% of all opportunities in the dataset. He also generates around 22.5% of total Won Revenue, which is very similar to his share of total opportunities.

At this stage, this suggests that Melvin's high Won Revenue is strongly influenced by the large number of opportunities he handles rather than having a significantly better Win Rate.

Dustin Brinkmann is in the same Central region but has the lowest Won Revenue of all managers despite having a slightly higher Win Rate than Melvin. This creates a useful comparison because both managers operate within the same region.

It is also worth noting that Cara Losch has the highest manager Win Rate at 64.43%, but her Won Revenue is considerably lower than Melvin's. This again shows that a higher Win Rate on its own does not necessarily lead to the highest revenue.

Further Investigation — Melvin vs Dustin

Question investigated
Why does Melvin generate significantly more Won Revenue than Dustin despite Dustin having a slightly higher Win Rate, and how much of the difference can be explained by opportunity volume and product mix?

Melvin vs Dustin — Product Mix Comparison

manager	Dustin Brinkmann			Melvin Marxen		
Product + Price	Opportunity Mix %	Total Opportunities	Won Revenue	Opportunity Mix %	Total Opportunities	Won Revenue
GTK 500 - $26,768				0.10%	2	
GTX Plus Pro - $5,482	10.61%	168	$448,503	9.23%	178	$483,401
GTX Pro - $4,821				27.37%	528	$1,104,109
MG Advanced - $3,393	21.10%	334	$458,229	12.70%	245	$370,718
GTX Plus Basic - $1,096	10.17%	161	$82,882	19.60%	378	$193,630
GTX Basic - $550	20.72%	328	$88,756	18.92%	365	$94,083
MG Special - $55	37.40%	592	$15,993	12.08%	233	$5,989
Total	**100.00%**	**1583**	**$1,094,363**	**100.00%**	**1929**	**$2,251,930**

Interpretation

Melvin's largest Opportunity Mix is GTX Pro at 27.37%, while Dustin's largest is MG Special at 37.40%. GTX Pro is the third-highest-value product at $4,821, while MG Special is the lowest-value product at $55.

MG Special makes up more than a third of Dustin's opportunities but generates only around $16K in Won Revenue, approximately 1.46% of his total Won Revenue.

In comparison, GTX Pro makes up 27.37% of Melvin's opportunities and generates approximately $1.10M in Won Revenue, around 49% of his total. Dustin has no GTX Pro opportunities at all.

The three lowest-value products make up approximately 68.29% of Dustin's opportunities compared with 50.60% for Melvin, a difference of around 17.69 percentage points.

Melvin also has much greater exposure to higher-value products. The three highest-value products make up around 36.70% of Melvin's opportunity mix compared with only 10.61% for Dustin.

This suggests that Melvin's higher Won Revenue is not only coming from having more opportunities. Product mix also appears to be a major factor and helps explain why Melvin's Average Won Deal Value is approximately $2,553 compared with around $1,465 for Dustin.

Key Conclusion

West is the strongest-performing region by Won Revenue and Win Rate, although regional Win Rate differences are relatively small. At manager level, Melvin stands out because he combines high opportunity volume with a more valuable product mix. Overall, manager and regional performance appears to be influenced by more than conversion alone: opportunity volume and product mix both play an important role.

Business Implication

Manager performance should not be assessed using Win Rate alone. Opportunity volume and product mix should also be considered, particularly when comparing teams with different levels of exposure to higher-value products.

9. Question 4 — Customer Sector Performance

Business Question

Which customer sectors generate the strongest sales performance, and what appears to be driving the differences in Won Revenue and Win Rate?

Metrics Used

- Won Revenue
- Won Deals
- Win Rate
- Average Won Deal Value
- Total Opportunities

Visuals Used

- Customer Sector Performance matrix
- Opportunity Volume vs Won Revenue scatter chart with trend line

Analysis Note

There are 1,425 open opportunities without an assigned customer sector. These were kept in the dataset but excluded from the sector performance comparison because they are still at the Prospecting or Engaging stage and cannot currently be linked to a specific customer sector.

Customer Sector Performance

Customer Sector Performance

sector	Won Revenue	Win Rate	Won Deals	Total Opportunities
employment	$436,174	62.59%	179	311
entertainment	$689,007	64.68%	260	451
finance	$950,908	61.17%	375	678
marketing	$922,321	64.85%	404	674
medical	$1,359,595	62.32%	592	1051
retail	$1,867,528	63.06%	799	1397
services	$533,006	63.35%	223	390
software	$1,077,934	63.92%	450	757
technolgy	$1,515,487	63.42%	671	1165
telecommunications	$653,574	62.50%	285	501
Total	**$10,005,534**	**63.15%**	**4238**	**7375**

Initial Findings

Retail is the strongest-performing customer sector in terms of Won Revenue, generating approximately $1.87M. It also has the highest number of Won Deals at 799 and the highest opportunity volume at 1,397 opportunities.

However, Retail's Win Rate is 63.06%, almost exactly in line with the overall average of 63.15%. This suggests that its higher Won Revenue is not being driven by a significantly better conversion rate.

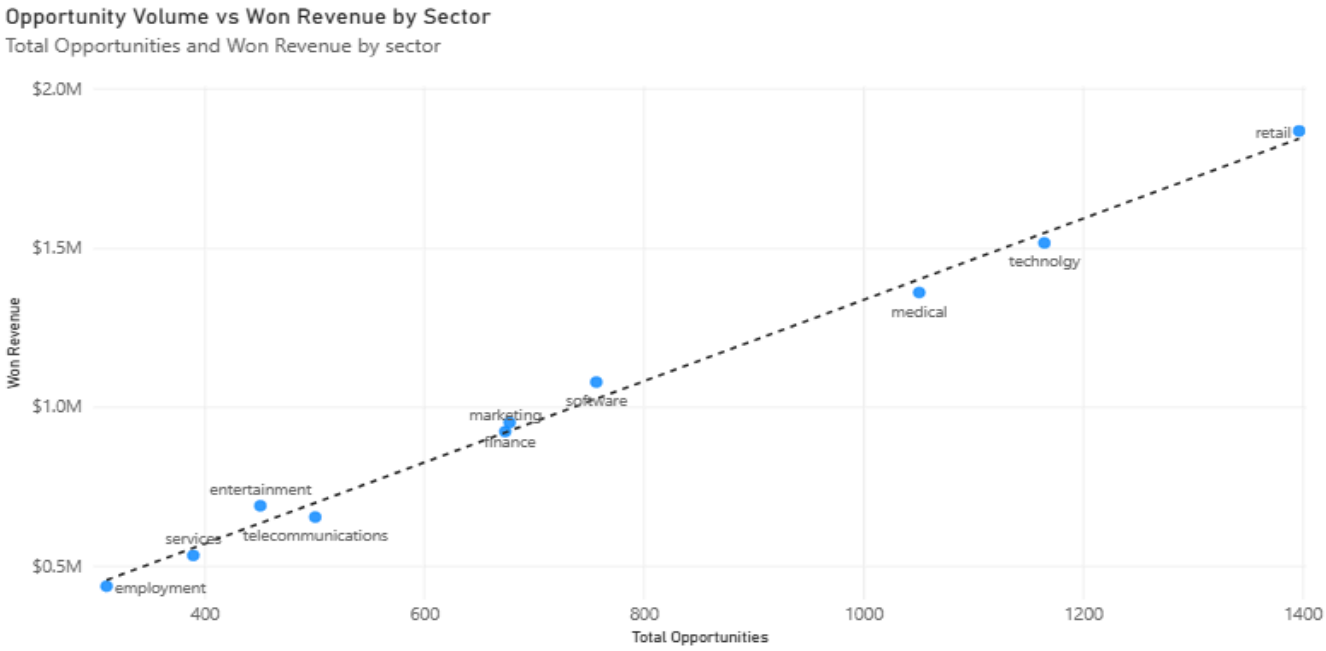

Retail makes up approximately 18.94% of all sector-assigned opportunities, 18.85% of Won Deals and around 18.66% of total Won Revenue. These figures are very closely aligned, suggesting that Retail's position as the highest-revenue sector is largely linked to the higher number of opportunities it receives.

Marketing provides an interesting comparison. It has the highest Win Rate at 64.85%, but generates only around $922K in Won Revenue from 674 opportunities. This again suggests that a higher Win Rate on its own does not necessarily lead to the highest overall revenue when opportunity volume is lower.

Retail's Average Won Deal Value is approximately $2,337, which is also close to the overall average of around $2,361. This strengthens the indication that Retail's revenue lead is mainly being driven by opportunity volume rather than significantly higher conversion or consistently higher-value deals.

Supporting Analysis — Opportunity Volume vs Revenue

Opportunity Volume vs Won Revenue by Sector

Interpretation

The scatter chart shows a clear positive relationship between Total Opportunities and Won Revenue across the customer sectors.

Most sectors sit fairly close to the trend line, with no major outliers. This suggests that sectors receiving more opportunities generally also generate more Won Revenue.

Retail follows this pattern closely, supporting the earlier finding that its position as the highest-revenue sector is mainly linked to its higher opportunity volume rather than having a significantly higher Win Rate or Average Won Deal Value.

Overall, the chart strengthens the view that opportunity volume is one of the main drivers of sector-level revenue performance.

Business Implication

The business should pay close attention to how opportunities are distributed across sectors, as higher opportunity volume appears closely linked to higher Won Revenue. Increasing quality opportunities in suitable sectors could therefore be an important way to support revenue growth.

Key Conclusion

Overall, Retail is the strongest-performing customer sector in terms of Won Revenue. However, its Win Rate and Average Won Deal Value are both close to the overall company averages. The main factor that appears to distinguish Retail is its higher opportunity volume. Across sectors more generally, the scatter analysis also shows a clear relationship between opportunity volume and Won Revenue, with no major outliers.

10. Final Executive Summary

Project Objective

For this project, I analysed a B2B CRM sales pipeline to understand sales performance across sales agents, products, managers and regions, and customer sectors.

The aim was to identify where the strongest sales performance was coming from, understand what was driving those results, and highlight areas the business could investigate to improve future sales performance.

Key Findings

- **Sales Agent Performance:** Darcel Schlechet generated the highest Won Revenue, despite having a Win Rate around the company average. He handled 65.6% more opportunities than the next-highest agent and had a larger share of higher-value products. This suggests his revenue lead was mainly linked to opportunity volume and product mix rather than a much higher overall Win Rate.
- **Product Performance:** GTX Pro and GTX Plus Pro were the strongest products for Won Revenue, together generating around 61% of the total despite making up only around 28% of opportunities. This shows how much product value matters alongside opportunity volume. High-value products such as GTK 500 also show that price alone is not enough when opportunity volume is very low.
- **Regional and Manager Performance:** West generated the highest Won Revenue and Win Rate, although the differences in regional Win Rates were relatively small. At manager level, Melvin Marxen generated the highest Won Revenue, with his lead appearing to be driven mainly by higher opportunity volume and a greater share of higher-value products rather than a significantly better Win Rate.
- **Customer Sector Performance:** Retail generated the highest Won Revenue and had the most opportunities, despite having a Win Rate close to the company average. Across the customer sectors, the scatter chart also showed a clear positive relationship between opportunity volume and Won Revenue, supporting the view that volume was a major factor.

Recommendations

Recommendation 1 — Opportunity Allocation

The business should review how sales opportunities are distributed across agents, managers and customer sectors. Throughout the analysis, higher Won Revenue was often linked with higher opportunity volume, particularly for Darcel, Melvin and the Retail sector.

It would be worth investigating why some areas receive significantly more opportunities and whether more suitable opportunities could be generated or allocated. Before making changes, the business should also look at the value and type of products involved, as higher opportunity volume alone does not guarantee stronger revenue performance.

Recommendation 2 — Product Strategy

Alongside opportunity volume, product mix played an important role. GTX Pro and GTX Plus Pro generated around 61% of total Won Revenue from only around 28% of opportunities. The comparisons between Darcel and other agents, and between Melvin and Dustin, also showed how much a higher-value product mix can influence results.

The business should investigate why these higher-value products receive fewer opportunities and whether there is potential to generate more. It would also be worth understanding why some agents and managers have greater exposure to them, whether that comes from customer demand, sales focus or how opportunities are allocated, before deciding where to focus sales efforts.

Recommendation 3 — Team Performance

The business should review how individual agents and managers are assessed, as higher Won Revenue does not necessarily mean someone is better at closing deals. Opportunity volume and product mix also played an important role in their overall performance.

It would also be worth looking at where agents perform particularly well with certain products. For example, Darcel had a higher Win Rate on GTX Plus Pro than the other agents. Understanding what contributes to this difference could help identify approaches worth sharing across the wider sales team.

Recommendation 4 — Customer Sector Performance

The business could investigate why Finance had the lowest Win Rate at 61.17%, compared with Marketing at 64.85%. Although the differences across sectors were relatively small, Finance also had one of the highest Average Won Deal Values, making its lower conversion worth a closer look.

It would be useful to understand whether the difference is linked to customer requirements, product mix or other factors. If there is an opportunity to improve conversion in Finance, it could help increase Won Revenue, but further analysis would be needed before making any changes.

Limitations & Further Analysis

Although the analysis showed a clear relationship between opportunity volume, product mix and Won Revenue, this does not necessarily mean these factors alone caused the differences in sales performance.

Further analysis would be needed to understand other factors, such as customer demand, the quality of opportunities and how they are allocated across agents and teams, before recommending any major changes to the sales strategy.

Overall Takeaway

> Across the project, **opportunity volume and product mix** appeared to explain more of the differences in Won Revenue than overall Win Rate alone. The main priority for the business is to understand why these opportunities and higher-value products are distributed differently, and where changes could realistically improve performance.
